

# [SYSTEM AND METHOD OF AUTOMATICALLY GENERATING KERF DESIGN DATA]

## Abstract

A method and system is provided to use the same design manipulation processes for both chip design and kerr design. Concurrent generation of kerr designs and chip designs provides a consistent, accurate, and repeatable process. Improved quality of wafer testing results because the data in the kerr matches data in the chip. The total cycle time for mask manufacturing is reduced because kerr build is accomplished prior to start of the mask manufacturing process. Also provided is the use of load balancing across multiple servers during kerr and chip design to optimize computing resources.
